1. Project Context and Objective

This project focuses on analyzing the results of the World Series of Poker (WSOP) Main Event, the most prestigious poker tournament in the world, from 1971 to 2025.
The dataset spans more than 50 years of competition and includes information about players, earnings, tournament entries, buy-ins, and country performance.
The WSOP Main Event is often considered the “Super Bowl of Poker”. Its rapid growth, especially after the early 2000s due to online poker and media exposure, makes it an ideal case study to analyze both competitive performance and global expansion.

2. Research Questions

This analysis aims to answer the following key questions:

- Which players have dominated the WSOP Main Event in terms of total earnings and consistency?
- How have prize pools and the number of participants evolved over time?
- Which countries produce the most successful players and top performers?
- Is there a relationship between the number of tournaments played and total earnings?
- Which years experienced the most significant increases or decreases in prize pool?

3. Power BI Report Structure

The dashboard is structured into four main pages:

- **Top Players Performance** → ranking of players based on earnings
- **Yearly Performance** → evolution of prize pool and participation over time
- **Country Performance** → comparison between countries
- **Global Performance Analysis** → overall insights using map and scatter analysis

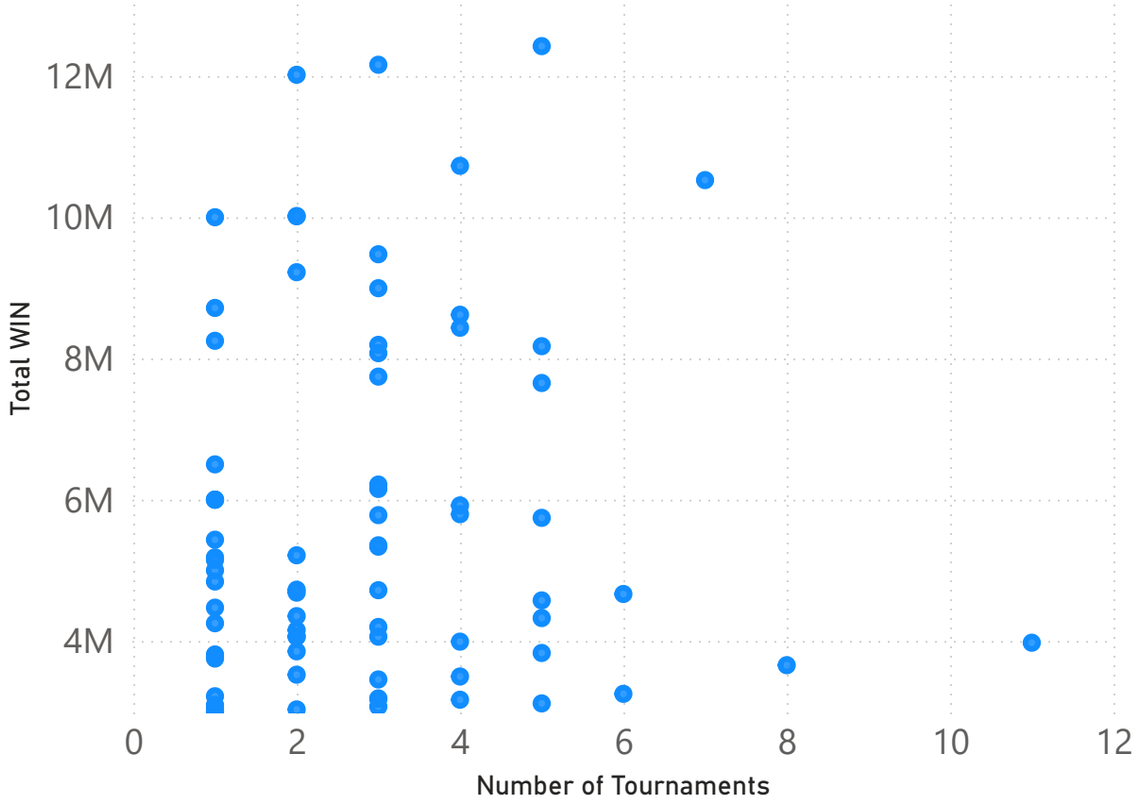
Number of Tournaments and Total WIN by name



1. Data Source and Import
The dataset was imported into Power BI Desktop from a CSV file containing WSOP Main Event results from 1971 to 2025 using:
Home → Get Data → Text/CSV
An additional dataset containing tournament entries was also imported and used to enrich the analysis.

2. Data Cleaning and Transformation (Power Query)
The following steps were performed:

- Verified and corrected data types:
- year → Whole Number
- prize, prizepool, buyin → Decimal
- entries → Whole Number
- Removed inconsistent or empty records
- Standardized country values (e.g., "US" and "USA" were unified) to ensure consistency across visuals
- Handled missing values:
- The "entries" column is only available for recent years
- Missing values were kept as null to avoid misleading interpretations
- Created a text version of the year field for slicer usage
- Disabled unwanted aggregation behavior on specific fields to prevent incorrect calculations
- Merged an additional dataset using:
- year
- name
- place

This ensured accurate matching without creating duplicate rows

3. Data Model
The data model is based on a main fact table:

- **wsop_main_event_results** (main dataset)

Additionally:

- A **Country dimension table** was created to support geographic analysis
- A relationship was established using the country field
- A basic time hierarchy was prepared:
